Abstract

1

2   A method of preparing a server is disclosed that supports a client system to construct

3   and preview a composite image. The composite image comprises first and second images.

4   The method of this invention comprises the steps of constructing at the server first and

5   second libraries, inputting to the server data representative of the sets of the first and second

6   images, and generating from the inputted set of first images a corresponding set of templates.

7   Each template bears a corresponding one of the set of the first images. Next, the set of

8   templates is loaded into the first library. Then, the set of second images is loaded into the

9   second library. In one illustrated embodiment of this invention, the first image represents a

10   promotional product, the second image represents a logo and the composite image is the logo

11   superimposed on the promotional product.
